Robot installation

• First of all, it is necessary to download and install the terminal MetaTrader 4.

• Thus, open your Metatrader 4 terminal, and then press File > then press Open Data Folder

Next open the MQL4 folder

And that's it – here we can copy our robot. The robot file must be placed in Experts folder.

• After that, restart our MetaTrader 4 terminal and go Tools> Options Click on the table Expert Advisors and mark the "Allow automated trading" and "Allow DLL imports" options. Click OK

• Find the Navigator box in your MetaTrader 4.

If You do not see this box, click on the yellow star button at the top of the terminal.

if you dont see navigator box

In Navigator, box clicks on plus icon before Expert Advisor category.

In the robot list, press the robot you need and towing the mouse directly on the prepared chart with the relevant currency pair and timeframe, suitable for the current robot.

• If everything is OK, the smiley face appears on the graph at the top right-hand corner.

If you smiley smiles it means all right – robot is working. If not, click the right mouse button on the chart, choose Expert Advisors (we get to the robot settings window), select Properties> Common and mark "Allow live trading" option.

If this doesn't help, You need to check whether the Autotrading button over the terminal. He must be green if red – click on it.

Thank You - NFX Team.
